RESEARCH INTERESTS

I am interested in how robots can efficiently perform long-horizon tasks in diverse environments such as homes and factories using foundation models, and how to collect and use data effectively.

- Vision-Language-Action models and robot foundation models
- Efficient data collection methods for foundation models (e.g., teleoperation, human demonstrations, simulation rollouts)
- Task planning for long-horizon manipulation

EDUCATION

Konkuk University

B.S. in Smart Vehicle Engineering, Institute of Convergence Engineering

- Cumulative GPA: 4.06 / 4.50 Major GPA: 4.08 / 4.50

Seoul, Republic of Korea

Mar. 2021 – Feb. 2027 (Expected)

H-Mobility Class — Robotics Track

Industry-academia program: ROS/Python, kinematics & motion planning, control & dynamics, perception & state estimation

Hyundai Motor Group

Apr. 2026 – Jun. 2026

RESEARCH EXPERIENCE

Korea Institute of Industrial Technology (KITECH)

Student Researcher, National Engineering R&D Center

Ansan, Republic of Korea

Jan. 2026 – Jun. 2026

- **Skill-wise Expert based Data Generation:** To reduce the high cost of teleoperation data collection, generated VLA fine-tuning data by simulator rollouts with skill-wise experts (teleop demos → Diffusion Policy based BC → Residual RL).
- **VIVA (VLM-Instructed VLA Architecture):** To overcome the long-horizon limitation of a single VLA model, designed a hierarchical VLM-VLA architecture where Qwen3-VL decomposes commands into skill plans and asynchronously updates $\pi_{0.5}$'s instructions based on real-time scene understanding. Achieved 38% / 28% / 18% success rates on Easy / Middle / Hard tasks vs. 2% / 6% / 0% (Only VLA baseline).

PUBLICATIONS & PRESENTATIONS

KSME 2026 Spring Annual Conference (Apr. 2026)

PROJECTS

Real-time Emergency-Stop Failure Prediction | PyTorch, PyBullet

Course project (Machine Learning, Konkuk Univ.).

Sep. – Dec. 2025

- Developed a time-series classifier that predicts vehicle braking failure caused by road condition changes (rain, snow) and triggers an early warning before failure occurs.
- **PyBullet simulation environment:** collected training data by randomizing physical variables (speed, mass, friction, braking timing) and integrated the model's threshold-based early-warning system into the simulator.
- **Transformer model training and evaluation:** achieved F1 0.89 and Acc 93.4%, selected as the final model with stable Precision of 93%, compared to GRU's 53%.

Path Planning & Control in Complex Driving Environments | ROS2, CARLA

Mar. – Jun. 2025

Konkuk Dream Semester independent project.

- Built a ROS2 + CARLA autonomous-driving system that navigates safely along an optimal route to the destination across diverse urban scenarios with static and dynamic obstacles and barricaded routes, using coordinated planning and control algorithms.
- **Planning & decision-making module:** designed the ROS2 node architecture and end-to-end pipeline that smoothly switches between algorithms based on driving context using simulator sensor data, and implemented A* global path planning, cubic/B-spline interpolation with curvature-based velocity planning, RRT-based static obstacle avoidance, and D* Lite-based global replanning.

UAV-UGV Cooperative Reconnaissance Platform | ROS2, PX4, Gazebo

Mar. – Jun. 2025

Course project (Autonomous System Platform, Konkuk Univ.).

- Built a cooperative-mission system for a UGV to transport a UAV to a takeoff point for reconnaissance, then meet it at a rendezvous point for landing. **Ranked 1st in course final evaluation.**
- **UGV planning and control:** designed routes and velocity profiles for the UGV to reach the takeoff point without dropping the carried UAV, and quickly return to the rendezvous point for the UAV's precision landing.
- **UAV ArUco marker global localization:** transformed the camera-frame relative coordinates of detected markers into world-frame global coordinates using the UAV's pose.

AWARDS & HONORS

President's List (Rank 1 / 37) — Konkuk University

Spring 2025

- Achieved 4.50 / 4.50 GPA, KU Convergence Engineering Institute.

Seoul RISE Director's Award — 1st Physical AI Hackathon

Feb. 8, 2026

- **Team Lead**, Team Ipalcheongchun. Track: Fine Folding (bimanual cloth folding).
- **Contribution:** Bimanual teleop setup, demo collection, ACT model training, and inference.

Encouragement Award — HL FMA 2025 aMAP Stride Championship

Nov. 4, 2025

- **Team Lead**, Team Ganadi. MORAI + ROS1.
- **Contribution:** GPS-IMU fusion for state estimation, curvature-based velocity planning, custom ROS messages for planning and control.

Special Award — 2025 Univ. Creative Mobility Competition, Autonomous Driving Track

Nov. 1, 2025

- Planning/Control SW Module Member, Team KAI.
- **Contribution:** Centroid-graph-based Greedy path planner, control using steering sensitivity adaptive Pure Pursuit algorithm.

Excellence Award — 2025 Univ. Creative Mobility Competition, Creative Technology Track

Nov. 1, 2025

- Planning/Control SW Module Member, Team KAI.
- **Contribution:** Delaunay-triangulation based path generation for cone gate driving, control using curvature and velocity adaptive Pure Pursuit algorithm.

Grand Prize — 8th Kookmin Univ. Autonomous Driving Competition

Aug. 28, 2025

- **Team Lead**, Team KAI.
- **Contribution:** Reed-Shepp + Stanley parking system in Preliminary (Gazebo) / lane estimation with YOLO and obstacle distance estimation via camera-LiDAR calibration for overtaking driving in Final (ROS2, real vehicle).

ETRI Director's Award — 4th Intl. Collegiate EV Autonomous Driving Competition

Jul. 12, 2025

- **Team Lead**, Team S.V.E. Basic Autonomous Mobility Race.
- **Contribution:** micro-ROS based Arduino-Jetson data communication pipeline, wall-section driving using 2D LiDAR + VFH algorithm, global pose estimation via motor encoder + IMU odometry for waypoint navigation.

TECHNICAL SKILLS

Programming language: Python, C++

Frameworks and Tools: ROS2, ROS1, PyTorch, Isaac Sim, Gazebo, CARLA, PyBullet, Linux, Git
